GDP Training Academy USB install

Before you start: Proxmox VE 9 must already be installed on a dedicated, empty server. Use a 32 GB or larger exFAT USB drive labelled ACADEMY. Copy the entire GDP Installer folder onto it. FAT32 cannot hold the package files.

1. Connect the USB drive. On another computer, open the new server's Proxmox web interface. Select the server node, open Shell, and sign in as root.
2. Paste this block into the Proxmox shell:

```
mkdir -p /mnt/academy
mount -t exfat -o ro /dev/disk/by-label/ACADEMY /mnt/academy
bash '/mnt/academy/GDP Installer/INSTALL.sh'
```

3. Answer the installer. Enter the website name you will use on your LAN, such as `academy.training.internal`. Enter a name only: no `https://`, IP address, or `.local` suffix. Review the detected network and storage, then type yes. The Academy VM sizes are set automatically. Leave the USB connected until completion.
4. Check the finish message. A successful run prints Academy installation complete and a receipt. If you close the shell, run the last command from step 2 again to see progress. You can also run:

```
cat /root/academy-install/state /root/academy-install/receipt.txt
```

5. Make the website reachable. On the LAN DNS server or router used by learner computers, add an A record from your website name to the Proxmox LAN IP in the receipt. The installer cannot change your router or DNS server.
6. Trust the site certificate on each learner computer. Copy `/root/academy-install/academy-ca.crt` from Proxmox and install that public CA certificate in the computer's trusted root store. Compare the Proxmox SSH fingerprint before copying it. The detailed `README.md` gives exact Windows commands. Never copy a `.key` file or bypass a browser certificate warning.
7. Sign in and check the Academy. In the Proxmox shell, run the following command. Read the username and password from its `out-data` field, then sign in at your website name. Change the administrator password, create learner accounts, and follow the acceptance record before admitting learners.

```
qm guest exec 9000 -- /bin/cat /opt/training-academy/secrets/initial-admin.txt
```

After installation finishes, run `umount /mnt/academy` to safely unmount the USB. The package's `README.md` and `INSTALLATION-GUIDE.pdf` contain the full instructions and troubleshooting steps.
